LOADING DATA

For this project, I will be using MIDI files of classical piano music. The dataset includes various artists. I will be working with Frédéric Chopin's compositions.

- First of all, I make a list of all the songs in the Chopin folder parsed as music21 stream.
- Then I will be creating a function to extract chords and notes out of the data creating a corpus.

Laoding and parsing data

```
#Loading the list of chopin's midi files as stream
filepath = "../input/classical-music-midi/chopin/"
#Getting midi files
all_midis= []
for i in os.listdir(filepath):
    if i.endswith(".mid"):
        tr = filepath+i
        midi = converter.parse(tr)
        all_midis.append(midi)
```

Next, I get the components out of these streams of MIDI files. The midi files only have the piano included as mentioned in the dataset. So the components of the file would be either piano chords or piano notes.

Note: The musical notes are the building blocks of the music. It pertains to a pitch associated with a specific audio vibration. Western music utilizes twelve musical notes.

Chord: A group of notes that sound good together is a chord.

The music21 stream that was created in the above cell contains both, chords and notes, we will extract them in the form of notes and obtain a series of notes in the musical composition.

The function to get the notes:

```
#Helping function
def extract_notes(file):
    notes = []
    pick = None
    for j in file:
        songs = instrument.partitionByInstrument(j)
        for part in songs.parts:
            pick = part.recurse()
            for element in pick:
                if isinstance(element, note.Note):
                    notes.append(str(element.pitch))
                elif isinstance(element, chord.Chord):
                    notes.append(".".join(str(n) for n in element.normalOrder))

    return notes
#Getting the list of notes as Corpus
Corpus= extract_notes(all_midis)
print("Total notes in all the Chopin midis in the dataset:", len(Corpus))
```

```
Total notes in all the Chopin midis in the dataset: 57887
```

```
print("First fifty values in the Corpus:", Corpus[:50])
```

```
First fifty values in the Corpus: ['6.10.1', 'F#2', 'F3', 'G#3', 'F#3', 'B-3', 'C#3', '6.10.1', 'F#2', 'F3', 'G#3', 'F#3', 'B-3', 'C#3',
```

All these values indicate the notes, as mentioned above.

Printing the music sheet

```
#First Lets write some functions that we need to look into the data
def show(music):
    display(Image(str(music.write("lily.png"))))

def chords_n_notes(Snippet):
    Melody = []
    offset = 0 #Incremental
    for i in Snippet:
        #If it is chord
        if ("." in i or i.isdigit()):
            chord_notes = i.split(".") #Seperating the notes in chord
            notes = []
            for j in chord_notes:
                inst_note=int(j)
                note_snip = note.Note(inst_note)
                notes.append(note_snip)
                chord_snip = chord.Chord(notes)
                chord_snip.offset = offset
                Melody.append(chord_snip)
        # pattern is a note
        else:
            note_snip = note.Note(i)
            note_snip.offset = offset
            Melody.append(note_snip)
        # increase offset each iteration so that notes do not stack
        offset += 1
    Melody_midi = stream.Stream(Melody)
    return Melody_midi

Melody_Snippet = chords_n_notes(Corpus[:100])
show(Melody_Snippet)
```

Playing the above sheet music

As I could not play a midi file on the Kaggle interface, I have created a ".wav" filetype of the same outside of this code. I am using it to create an audio interface. Let us have a listen to the data corpus.

```
#to play audio or corpus
print("Sample Audio From Data")
IPython.display.Audio("../input/music-generated-lstm/Corpus_Snippet.wav")
```

```
Sample Audio From Data
```

0:00 / 0:51

Examine all the notes in the Corpus

```
#Creating a count dictionary
count_num = Counter(Corpus)
print("Total unique notes in the Corpus:", len(count_num))
```

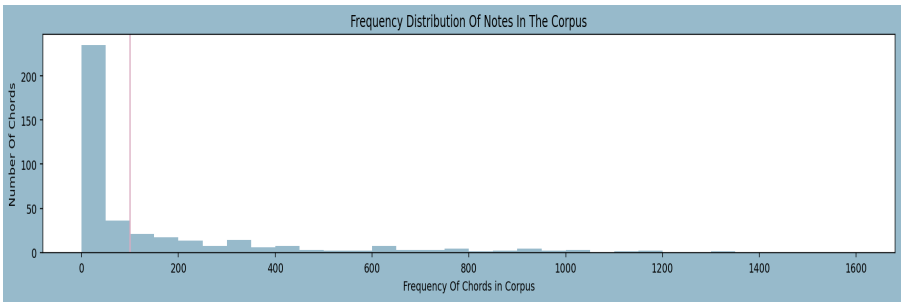
```
Total unique notes in the Corpus: 397
```

```
#Exploring the notes dictionary
Notes = list(count_num.keys())
Recurrence = list(count_num.values())
#Average recurrenc for a note in Corpus
def Average(lst):
    return sum(lst) / len(lst)
print("Average recurrenc for a note in Corpus:", Average(Recurrence))
print("Most frequent note in Corpus appeared:", max(Recurrence), "times")
print("Least frequent note in Corpus appeared:", min(Recurrence), "time")
```

```
Average recurrenc for a note in Corpus: 145.8110831234257
Most frequent note in Corpus appeared: 1627 times
Least frequent note in Corpus appeared: 1 time
```

Clearly, there are some very rare notes in the melody; some so rare that it was played only once in the whole data. This would create a lot of problems. (I did run into most of them while writing this piece) To spare us the error reports, let us have a look at the frequency of the notes. And for simplicity, I shall be eliminating some of the least occurring notes. I am sure Chopin wouldn't mind me messing with his masterpiece for science or would he? Either way, I may never know!

```
# Plotting the distribution of Notes
plt.figure(figsize=(18,3),facecolor="#97BACB")
bins = np.arange(0,(max(Recurrence)), 50)
plt.hist(Recurrence, bins=bins, color="#97BACB")
plt.axvline(x=100,color="#DBACC1")
plt.title("Frequency Distribution Of Notes In The Corpus")
plt.xlabel("Frequency Of Chords in Corpus")
plt.ylabel("Number Of Chords")
plt.show()
```



I have decided, I will be taking out the notes that were played less than 100 times. I mean, if Chopin liked them he would have played it a lot more often. So I create a list of rare notes in the next section.

```
#Getting a list of rare chords
rare_note = []
for index, (key, value) in enumerate(count_num.items()):
    if value < 100:
        m =  key
        rare_note.append(m)

print("Total number of notes that occur less than 100 times:", len(rare_note))
```

```
Total number of notes that occur less than 100 times: 271
```

```
#Eleminating the rare notes
for element in Corpus:
    if element in rare_note:
        Corpus.remove(element)

print("Length of Corpus after elemination the rare notes:", len(Corpus))
```

```
Length of Corpus after elemination the rare notes: 53712
```

```
# Storing all the unique characters present in my corpus to bult a mapping dic.
symb = sorted(list(set(Corpus)))

L_corpus = len(Corpus) #length of corpus
L_symb = len(symb) #length of total unique characters

#Building dictionary to access the vocabulary from indices and vice versa
mapping = dict((c, i) for i, c in enumerate(symb))
reverse_mapping = dict((i, c) for i, c in enumerate(symb))

print("Total number of characters:", L_corpus)
print("Number of unique characters:", L_symb)
```

```
Total number of characters: 53712
Number of unique characters: 266
```

Encoding and Splitting the Corpus as Labels and Targets

```
#Splitting the Corpus in equal length of strings and output target
length = 40
features = []
targets = []
for i in range(0, L_corpus - length, 1):
    feature = Corpus[i:i + length]
    target = Corpus[i + length]
    features.append([mapping[j] for j in feature])
    targets.append(mapping[target])

L_datapoints = len(targets)
print("Total number of sequences in the Corpus:", L_datapoints)
```

```
Total number of sequences in the Corpus: 53672
```

```
# reshape X and normalize
X = (np.reshape(features, (L_datapoints, length, 1)))/ float(L_symb)
# one hot encode the output variable
y = tensorflow.keras.utils.to_categorical(targets)
```

Splitting Train and Seed datasets

```
#Taking out a subset of data to be used as seed
X_train, X_seed, y_train, y_seed = train_test_split(X, y, test_size=0.2, random_state=42)
```

```
#Initialising the Model
model = Sequential()
#Adding layers
model.add(LSTM(512, input_shape=(X.shape[1], X.shape[2]), return_sequences=True))
model.add(Dropout(0.1))
model.add(LSTM(256))
model.add(Dense(256))
model.add(Dropout(0.1))
model.add(Dense(y.shape[1], activation='softmax'))
#Compiling the model for training
opt = Adamax(learning_rate=0.01)
model.compile(loss='categorical_crossentropy', optimizer=opt)

```

```

```

EVALUATING MODELS

Now that I have my model trained on the MIDI files of piano music, let us see how it performs.

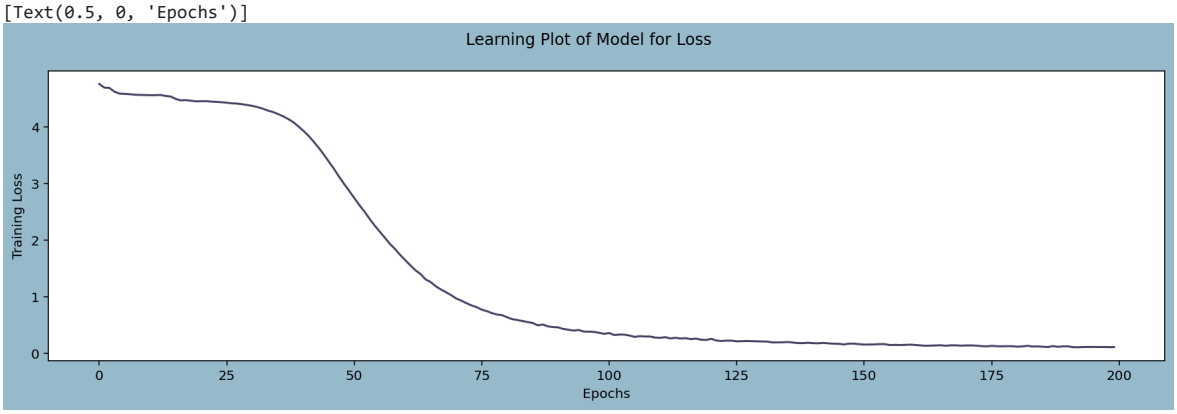
To evaluate my model, I shall be having a look at:

- The performance of the model via Learning Curves
- The melody created

Plotting the learning curve for the loss function

```
#Plotting the learnings
history_df = pd.DataFrame(history.history)
fig = plt.figure(figsize=(15,4), facecolor="#97BACB")
fig.suptitle("Learning Plot of Model for Loss")
pl=sns.lineplot(data=history_df["loss"],color="#444160")
pl.set(ylabel ="Training Loss")
pl.set(xlabel ="Epochs")
```

```
[Text(0.5, 0, 'Epochs')]
```



Generating the Melody

A function to obtain the generated music

```
def Malody_Generator(Note_Count):
    seed = X_seed[np.random.randint(0,len(X_seed)-1)]
    Music = ""
    Notes_Generated=[]
    for i in range(Note_Count):
        seed = seed.reshape(1,length,1)
        prediction = model.predict(seed, verbose=0)[0]
        prediction = np.log(prediction) / 1.0 #diversity
        exp_preds = np.exp(prediction)
        prediction = exp_preds / np.sum(exp_preds)
        index = np.argmax(prediction)
        index_N = index/ float(L_symb)
        Notes_Generated.append(index)
        Music = [reverse_mapping[char] for char in Notes_Generated]
        seed = np.insert(seed[0],len(seed[0]),index_N)
        seed = seed[1:]
    #Now, we have music in form or a list of chords and notes and we want to be a midi file.
    Melody = chords_n_notes(Music)
    Melody_midi = stream.Stream(Melody)
    return Music,Melody_midi

#getting the Notes and Melody created by the model
Music_notes, Melody = Malody_Generator(100)
show(Melody)
```

```

This sure looks like music! To check if it sounds like music we have to listen to the MIDI file. Playing midi is crumblesome. I have saved and converted a few generated melodies to ".wav" format outside of this notebook. So let us have a listen.

Melody Generated Sample 1

```
#To save the generated melody
Melody.write('midi','Melody_Generated.mid')
#to play audio or corpus
IPython.display.Audio("../input/music-generated-lstm/Melody_Generated 2.wav")
```

0:00 / 0:52

Melody Generated Sample 2
